The Design, Implementation, and Audit of Occupational Health and Safety Management Systems - Ron C. McKinnon 2019-11-20
This book covers the design, implementation, and auditing of structured occupational health and safety management systems (SMS), sometimes referred to as safety programs. Every workplace has a form of SMS in place as required by safety regulations and laws. The Design, Implementation, and Audit of Occupational Health and Safety Management Systems describes some of the elements that constitute an SMS, the implementation process, and the auditing of the conformance to standards. It covers more than 60 processes, programs, or standards of a system, and gives important background information on each element. Guidelines and examples show how to design and implement the risk-based processes, programs and standards, and how to audit them against standards. The text is based on actual SMS implementation experiences across a wide range of industries. It offers a roadmap to any organization which has no structured SMS. It will guide them through the process of upgrading their health and safety processes to conform to local and international standards. It will lead them away from relying on reactive safety measures such as injury rates, to proactive actions which are measured by the audit of the system. Features Covers more than 60 elements of a safety management system (SMS) Provides practical examples of how to design, implement, and audit a structured SMS Based on actual SMS implementation experience across a wide range of industries Presents the integration of an SMS into the day-to-day functions of the organization

The book is arranged in categories so that it can be used in handbook fashion; each section stands independent of the others. The arrangement of the major portion of the book is organized in the same format as we usually find in building construction specification, the Construction Specifications Institute (CSI) format.

Manuals Combined: BASIC FOOD INSPECTION PROCEDURES, STORAGE AND SANITATION, DETERIORATION & PRESERVATION OF

POULTRY, DAIRY, RED MEAT, POULTRY, SHELL EGGS, FRUITS, VEGETABLES AND WATERFOODS - 2019-03-14

Over 1,300 total pages ... INTRODUCTION Food is surrounded by dangerous agents and conditions that can make people ill. As multiple handling and modern processing methods lengthen the journey from farm to table, the opportunities for food to become contaminated and/or spoiled increase. The veterinary food inspection specialist helps protect the food utilized by the military by insuring sanitary control of food establishments handling food for military use. This course discusses these sanitary controls. Foods undergo deterioration of varying degrees in their sensory characteristics, nutritional value, safety, and aesthetic appeal. Most foods, from the time they are harvested, slaughtered, or manufactured, undergo progressive deterioration that, depending upon the food, may be very slow or so rapid as to render the food virtually useless in a matter of hours. This presents a problem to the Department of Defense because food supplies have to be purchased well in advance of anticipated usage. Large quantities of food are lost each year due to deterioration. The problem is due to the perishable nature of food, as well as to the rather lengthy Defense subsistence supply chain. Due to these factors, veterinary food inspection specialists are tasked with recognizing deterioration in subsistence and making recommendations to preclude public health problems and financial losses to the Government. How do bacteria reproduce? Does the bacterial cell contain a nucleus? What are the shapes of bacteria? If you cannot answer these questions now, you should be able to when you have completed this course, and you should also know the answers to many other questions. For those of you who already know this material, let it serve as a review. Why are we interested in bacteria? Because some bacteria are capable of waging war on the human race and some bacteria are capable of benefiting our lives. We need to know the difference. Bacteria are microorganisms and microorganisms are the smallest of all organisms; for example, 2,000 of them can be lined up across the head of a common pin. In this subcourse, we will be concerned with those tiny organisms that are unfriendly, because they are responsible for a large percentage of spoilage in foods. We believe it is important to know about those microorganisms that cause food deterioration so that we can eliminate deterioration in foods before it occurs.
